May 24, 2016

The Honorable Mark Kirk
Hart Senate Office Building
Washington, D.C. 20510

Dear Senator Kirk:

We write to express our concerns with your legislation the “Reliable and Effective Growth for Regenerative Health Options that Improve Wellness” or the “REGROW Act” as distributed for the recent Senate HELP Committee markup (“Amendment 1; document BOM 16344”). We applaud your recognition of the cell and gene therapy and regenerative medicine sector as a field with tremendous therapeutic promise for patients with unmet medical needs. However, efforts to speed these products to market must be done with patient safety as a topmost priority.

We are concerned that the REGROW Act as currently drafted could compromise patient safety by providing “conditional approval” to products that simply show “preliminary clinical evidence of safety” as part of Phase I and Phase II trials. We are troubled that these provisions establish a new approval standard that is potentially lower than existing standards. By allowing products to be marketed as approved therapies, this implies to patients a high level of approval which is not warranted given the current requirements in the bill. We believe this proposed legislation may result in grave consequences for patients.

We have additional concerns on the impact of the REGROW Act as it is drafted today including that its provisions make it difficult for the FDA to withdraw such products from the market should the agency find safety problems.

There exist several pathways to get critical treatments to patients quickly while maintaining strong FDA safety and efficacy standards. These programs are aimed at unmet needs for serious life-threatening diseases that currently have no adequate approved treatment options. Consequently, we cannot support the REGROW Act in its current form. We look forward to the continued dialogue between the sponsors of the REGROW Act as well as other stakeholders and policy makers to create alternative approaches that will provide access to these therapies in an accelerated way that does not compromise patient safety, efficacy and the public trust.

Sincerely,
