

September 8, 2017

The Honorable Thomas E. Price, MD  
Secretary  
U.S. Department of Health & Human Services  
200 Independence Avenue, S.W.  
Washington, D.C. 20201

Dear Secretary Price,

Created in 2014, the Partnership for Part D Access (“the Partnership”) is a coalition of healthcare stakeholders committed to maintaining access to medications under the Medicare Part D program. The Partnership and its members work with a broad range of organizations to ensure the continued protection of the categories and classes of drugs identified for unique patient access under the Social Security Act (the “protected classes”). These medications are vital to the treatment of: (1) epilepsy; (2) mental illness; (3) cancer; (4) HIV-AIDS; and (5) organ transplants. The Partnership and other concerned stakeholders are writing to urge the Department of Health and Human Services to take steps to assure and maintain access to medications under Medicare Part D’s protected classes policy, a central patient protection for Medicare beneficiaries.

The Partnership was founded to combat efforts to undermine consumer access to appropriate treatment by increasing policymaker awareness of the vulnerability of patients with conditions within these protected classes and the potential impact of delayed or denied care. The Partnership’s membership currently includes a variety of patient advocacy organizations, such as the National Council for Behavioral Health, Transplant Recipients International Organization (TRIO), The AIDS Institute, Epilepsy Foundation, Cancer Support Community, National Alliance on Mental Illness (NAMI), and the National Kidney Foundation, as well as representatives of industry stakeholders.

### **The Protected Classes Are Critically Important to Vulnerable Patients**

The protected classes policy is essential for maintaining access to proper treatment for Medicare beneficiaries. Patients with a condition in one of the protected classes have very complicated medical needs, and many of these patients must attempt a variety of therapies before coming to a decision with their physicians about what is the most appropriate treatment. For example, patients often have significant co-morbidities, requiring nuanced treatment regimens.

Patients with mental health conditions often have high rates of diabetes and heart disease, which may be exacerbated by untreated mental illness.<sup>1</sup> Additionally, one in four individuals with cancer has clinical depression.<sup>2</sup> The protected classes policy shields them from arbitrary restrictions and limitations that may hinder access to important medications.

While the protected classes policy protects patients, Part D plans have a number of tools that they use to control costs through utilization management and rebate negotiation. For example, under current guidance issued by the Centers for Medicare and Medicaid Services (CMS), for drugs other than those relating to HIV, Part D plans may use prior authorization and step therapy to manage therapies for any beneficiary beginning treatment on a protected class drug.<sup>3</sup> In addition, Part D plans may utilize formulary tiering to steer patients toward lower cost drugs. These tools give Part D plans considerable flexibility to manage more expensive medications, as well as leverage to negotiate rebates with manufacturers.

### **The Protected Classes Lower Medicare Spending and Promote Adherence**

An August 2016 study from researchers at Northwestern University's Kellogg School of Management and the University of Texas at Austin highlights how "profit-maximizing" Part D plans are incentivized to limit benefits or increase certain costs for which Part D plans are not responsible under Medicare (e.g., hospitalizations).<sup>4</sup> As detailed in the study, Part D plans are explicitly encouraged to reduce drug spending without bearing financial responsibility for the holistic health of the patient. The authors conclude that in covering drugs less generously, Part D plans end up costing traditional Medicare \$475 million per year.<sup>5</sup> The study reinforces the importance of Medicare's six protected classes in limiting future medical complications, hospitalizations, and additional costs to the Medicare program.

Further, a March 2016 literature review conducted by Avalere Health suggests little evidence exists to show that limiting formulary access leads to meaningful cost savings.<sup>6</sup> The authors observed that while formulary restrictions often lead to lower drug spending, they were accompanied by increases to inpatient and outpatient medical care that outweighed savings achieved on prescription drugs.<sup>7</sup> They also found evidence to suggest that formulary restrictions led to increased rates of non-adherence, especially among older beneficiaries.<sup>8</sup> The authors further noted that studies indicate

patients who were less adherent or who switched their therapies had higher hospitalization rates with longer stays.

### **History of Support for the Protected Classes**

When Congress passed the Medicare Modernization Act of 2003 (MMA), it sought to ensure that all individuals would have access to robust prescription drug benefits, regardless of their clinical conditions.<sup>9</sup> To that end, the MMA forbade an approved prescription drug plan (PDP) from having a design and formulary that was “likely to substantially discourage enrollment” by certain classes of patients.<sup>10</sup> Furthermore, in a Senate colloquy just before the enactment of the MMA, Senators repeatedly emphasized the importance of safeguards, including the protected classes, available to beneficiaries who need “exactly the right medicine for them.”<sup>11</sup>

To implement the MMA statutory requirements, CMS issued subregulatory guidance in 2005, specifying that plans cover “all or substantially all” of the drugs in six categories: antidepressants, antipsychotics, anticonvulsants, antineoplastics, antiretrovirals and immunosuppressants. These categories became known as the classes of “clinical concern” or “six protected classes.” CMS stated that it had a responsibility to ensure Medicare beneficiaries received clinically appropriate medications and had “uninterrupted access” to all drugs in these classes.<sup>12</sup> For beneficiaries already stabilized on a drug in these categories, CMS’ expectation was that plans would not use formulary management techniques, such as prior authorization or step therapy, absent “extraordinary circumstances.”<sup>13</sup>

In 2008, Congress passed the Medicare Improvements for Patients and Providers Act (MIPPA), which included language affecting the six protected classes.<sup>14</sup> Section 176 of MIPPA required the Secretary of Health and Human Services (HHS) to establish a process for determining the appropriate categories and classes of protected drugs, beginning with plan year 2010. MIPPA replaced CMS’ “substantially all” standard, instead requiring that “all” drugs in the protected classes be covered.<sup>15</sup>

When the Affordable Care Act (ACA)<sup>16</sup> was enacted in 2010, again there were provisions related to the six protected classes. Section 3307 of the ACA required the HHS Secretary to identify categories and classes of drugs that are of clinical concern through the promulgation of regulations, including a notice and comment period. In addition, for the first time, the existing six protected

<sup>16</sup> Public Law 111-148 (March 23, 2010).

classes were recognized in statute. Also of importance, the ACA reiterated that PDP sponsors must cover *all* drugs within the protected classes.<sup>17</sup>

In early 2014, CMS proposed sweeping changes to the protected classes requirements within a proposed rule that made policy and technical changes to the Medicare Advantage (MA) and prescription drug benefit programs for calendar year 2015.<sup>18</sup> Under the proposed rule, CMS would keep only three categories of drugs as protected classes: antiretrovirals, antineoplastics, and anticonvulsants. It proposed to remove immunosuppressants and antidepressants from the classes of clinical concern in 2015, but to keep antipsychotics for that year only.

The proposed regulation was met with extraordinary opposition by Congress, patient groups and others concerned with access to medications for Medicare beneficiaries. All members of the Senate Finance Committee wrote to HHS opposing the proposed redefinition of the protected classes and said they were unconvinced that cost savings would materialize.<sup>19</sup> Fifty bipartisan members of the House Ways & Means and Energy & Commerce Committees wrote to oppose the proposal, saying it would “place harmful limits on Medicare beneficiaries’ access to necessary medications that would otherwise be covered.”<sup>20</sup> Well over 1,400 comments were submitted by patient organizations, medical guilds, and other patient-focused groups to CMS opposing the change.

Ultimately, CMS did not finalize the proposed rule, stating it “did not strike the balance among beneficiary access, quality assurance, cost containment and patient welfare” that it had hoped to achieve.<sup>21</sup> Instead, in its final rule CMS stated that categories and classes of drugs of clinical concern would continue to be the six enumerated in the ACA until such time as the agency could undertake rulemaking to establish new criteria.<sup>22</sup>

As represented by the diversity of organizations signing this letter, the Part D program has been both popular among Medicare beneficiaries and successful in providing affordable drug coverage to them. We ask HHS to support retaining the six protected classes in their present form as the Department examines ways to address drug pricing and benefit design. Further, members of the Partnership would welcome the opportunity to meet with you in person to discuss this important issue.

Sincerely,
